For this lab, I successfully installed both VirtualBox and Cloudera. While d_ownloading the software was straightforward, I encountered an issue when importing Cloudera into VirtualBox. The error message indicated that the Virtual Machine could not detect the VMDK file. To resolve this, I renamed the VMDK file, which allowed me to successfully import Cloudera. During the lab session, Dr. Mohsen instructed us to begin with Lab 2, where we explored basic Linux terminal commands. We revisited key commands such as ls, cmd, cat, and mkdir, and learned how to use the global path to locate files within the file system. This was a helpful refresher, and I enjoyed getting hands-on practice with the terminal.
